Brandon M. Keltz An Introduction to Computational Science by Allen Holder and Joseph Eichholz Chapter 2 - Solving Systems of Equations November $15,\,2019$

Problem 2. Show that the product of upper (lower) triangular matrices is upper (lower) triangular.

Proof. Without loss of generality, let A and B be upper triangular matrices, where A and B have dimensions $m \times n$ and $n \times m$, respectively. The product of A and B is

$$c_{ij} = \sum_{k=1}^{\min\{m,n\}} a_{ik} b_{kj} = \sum_{k=1}^{i-1} a_{ik} b_{kj} + \sum_{k=i}^{j} a_{ik} b_{jk} + \sum_{k=j+1}^{\min\{m,n\}} a_{ik} b_{kj}.$$

Notice that for all k < i we have

$$\sum_{k=1}^{i-1} a_{ik} b_{kj} = 0$$

because A is upper triangular. Similarly, for all k > j we have

$$\sum_{k=j+1}^{\min\{m,n\}} a_{ik} b_{kj} = 0$$

because B is upper triangular. This gives

$$c_{ij} = \sum_{k=i}^{j} a_{ik} b_{jk},$$

which is zero for j < i. So, by definition C must also be an upper triangular matrix.
